

Abstract of the Disclosure

A paper product, such as a facial tissue, that is capable of transferring beneficial chemical agents to the user is disclosed. In one embodiment, the paper product is treated with a siloxane treatment that contains two (2) siloxanes. The first siloxane bonds to pulp fibers contained within the paper product. The second siloxane composition, on the other hand, is bonded to a beneficial chemistry agent. When contacted with a user's skin, the second siloxane composition bonded to the beneficial chemistry agent is transferred to the user's skin.
